For the following format specifiers, PLEASE FILL OUT COMPLETE INFORMATION. It will not be sufficient to copy and paste information you find on the internet. For your own success in this lesson you should articulate your understanding of how each of these specifiers work.

%f	When do you use it? To display a floating point value in decimal format. How does it work? Float arguments are converted to double. Provide examples: :double = 4.5 System.out.format("My GPA is %f");
%d	When do you use it? To display a decimal, base 10, integer. How does it work? Corresponds to an integer value or a variable of type **int** in the corresponding position in the argument list. Provide examples: int x = 17 System.out.format("I am %d years old");
%s	When do you use it? To display strings. How does it work? Determines space to put in the indent. Provide examples: String = "December" System.out.format("I was born in %s")
